The core science curriculum includes classes in Molecular Biology of the Cell, Methods in Cellular and Molecular Pathology, The Molecular Pathology of Cancer, and Neurologic and Muscle Disease. Learning is focused on reading and evaluating current scientific literature, with special attention to identifying the major open questions within a field and designing an effective experimental plan to answer these questions. Two electives (6 units total) are required. Electives taught by program faculty are offered in Microbial Pathogenesis (4 units) and Mouse Models for Human Disease (2 units). Electives may also be selected from graduate-level courses offered by other medical school programs or by other campus departments (e.g., Division of Biological Sciences, Department of Chemistry and Biochemistry, and Department of Bioengineering). This option allows students the opportunity to acquire advanced training in areas they have selected for graduate research. Popular electives are Molecular Modeling, Macromolecular Recognition, Molecular Biology of the Cardiovascular System, and graduate-level courses in Signal Transduction, Immunology, Animal Virology, Developmental Biology, Genetics, and Neurobiology. An education in histology and pathology is acquired by taking the School of Medicine course in Histology and an overview course in human pathology developed by pathology faculty for molecular pathology and pharmacy students. Students may elect to take in-depth pathology training in their particular disease(s) of interest by attending a set of comprehensive lectures (eight to twelve) taught as part of the comprehensive medical school pathology curriculum. Concurrent with their thesis research, third-year students may acquire a practical consideration of the clinical treatment of disease by attending pathology conferences: Breast Pathology Conference, Tumor Board, Pediatric Autopsy, Neuropathology “Brain-Cutting” Conference, Infectious Disease Rounds, or Hematology Conference. In such conferences, students learn how disease presents and progresses, how physicians currently treat disease, what the practical obstacles are in disease treatment, and where opportunities are for development of molecular therapeutics.

EXAMINATIONS

First Qualifying Examination (Minor Proposition)

The purpose of this examination is to test the student’s ability to choose a research problem in molecular pathology and to propose an experimental approach to its solution. The problem should be unrelated to the student’s thesis project. The student is expected to demonstrate knowledge in molecular cell biology; stem cell and developmental biology; neurobiology and neurologic disease; structural biology and signal transduction; microbiology and immunology; and cardiovascular, muscle, and organ development/disease. Most program faculty reside in the Departments of Pathology, Medicine, and Pediatrics at the UCSD School of Medicine, in the Burnham Institute, and in The Scripps Research Institute.

THE GRADUATE PROGRAM

The Molecular Pathology Program is closed for entrance of new students as of the 2008 academic year. The program has been integrated into the Biomedical Sciences Program as a track in the Biomedical Sciences Program.

The goal of the molecular pathology program is to produce outstanding researchers focused on the molecular basis of human disease who also understand disease at levels of histology and pathology. The molecular pathology graduate program is an interdepartmental and interinstitutional program administered by the UC San Diego Department of Pathology in affiliation with the Burnham Institute. The program provides a comprehensive knowledge of normal and abnormal biological processes, with a particular emphasis on the molecular mechanisms of human diseases. Faculty research focuses on determining how normal cellular processes are altered in human disease. Research falls within six areas: cancer biology; stem cell and developmental biology; neurobiology and neurologic disease; structural biology and signal transduction; microbiology and immunology; and cardiovascular, muscle, and organ development/disease. Most program faculty reside in the Departments of Pathology, Medicine, and Pediatrics at the UCSD School of Medicine, in the Burnham Institute, and in The Scripps Research Institute.

COURSE WORK

The core science curriculum includes classes in Molecular Biology of the Cell, Methods in Cellular and Molecular Pathology, The Molecular Pathology of Cancer, and Neurologic and Muscle Disease. Learning is focused on reading and evaluating current scientific literature, with special attention to identifying the major open questions within a field and designing an effective experimental plan to answer these questions. Two electives (6 units total) are required. Electives taught by program faculty are offered in Microbial Pathogenesis (4 units) and Mouse Models for Human Disease (2 units). biology and basic pathology. The first qualifying examination will be taken by the end of the fall quarter of the second year.

**Second Qualifying Examination (Major Proposition)**

The second qualifying examination, a university requirement, consists of an oral report by the student about research accomplished and the goals to be achieved for completion of the examination, the student will advance to candidacy. The second qualifying examination should be complete by the end of the third year and must be completed by the end of the fourth year.

**DEPARTMENTAL PH.D. TIME LIMIT POLICIES**

Students must be advanced to candidacy by the end of four years. Total university support cannot exceed six years. Total registered time at UCSD cannot exceed seven years.

**COURSES**

*For course descriptions not found in the UC San Diego General Catalog, 2010–11, please contact the department for more information.*

**SPPS 215. Human Disease (3)**
This introduction to human disease includes etiology and mechanisms of common disease states and integrates pathology with previous core curriculum. Students will focus on an understanding of disease processes and the dynamics of changes related to drug therapy. **Prerequisites:** admission to the School of Pharmacy and Pharmaceutical Sciences, or admission to the Molecular Pathology Graduate Program, or consent of instructor.

**PATH 220. Drugs and Disease: Nervous System Disease and Therapy (4)**
This course will explore the molecular pathology associated with various diseases other than cancer. Emphasis will be placed on understanding the aberrant cellular processes, caused by mutation or environmental factors, that are associated with the disease state. Cardiovascular, neurological, immunological, and other diseases will be investigated.

**PATH 221. Molecular Pathology of Cancer (4)**
The purpose of this course is to present exciting new developments in molecular carcinogenesis, with particular emphasis on oncogene expression and functions of oncoproteins. The relevance of molecular mechanisms for understanding human cancer will be discussed.

**PATH 222. Microbial Pathogenesis (4)**
Topics covered in this course include molecular and cellular mechanisms of viral, bacterial, and protozoan pathogenesis. Host response and microbial mechanisms of host defense will also be discussed. Sessions will consist of faculty and student presentations of current literature.

**PATH 223. Mouse Models of Human Disease (2)**
This course provides an overview of the use of mouse models in biomedical research. Sessions will cover general mouse biology, genetics, and technologies for generating mutant mice; and will focus on model selection, methodological approaches, data interpretation, experimental design, and ethics of animal research. Student participation and discussion will be encouraged. **Prerequisite:** graduate standing or consent of instructor.

**PATH 225. Molecular Pathology Research Seminars (2)**
This course presents developments in cellular and molecular pathology research. Both faculty and students actively participate in the individual sessions. All students are required to give one to two formal presentations (under faculty supervision) during the year. The relevance of molecular mechanisms for understanding human disease will be discussed. **Prerequisite:** consent of instructor.

**PATH 228/PHAR 228/BIOM 228. Modern Drug Discovery Technologies (2)**
Drug discovery is an emerging science available to academic investigators. This course provides an overview of these drug discovery techniques, including high throughput screening, cell-based screening, computational methods of lead compound discovery, and chemical methods of optimization. **Prerequisite:** graduate student status or consent of graduate program director.

**PATH 230G. Molecular Biology of the Cell (6)**
This course offers a concise overview of the biochemical basis of gene expression and of diverse signal transduction pathways, and integrates this background in the context of cellular processes such as cell division, development, cell-cell interactions, and inflammation. This course will highlight recent discoveries in cellular and molecular biology and will highlight human diseases that result from inappropriate regulation of cellular processes.

**PATH 231. Modern Methods in Molecular and Cell Biology (4)**
This course presents key concepts and methodologies used in cellular and molecular pathology research. Topics include protein purification, biochemical characterization, identification of post-translational modifications, DNA/protein microinjection, immunofluorescence, digital imaging, electron microscopy, stem cell culture, gene/promoter analysis, protein-protein interaction analysis using the yeast 2-hybrid system, transgenic and knockout mouse construction, analysis of bacterial virulence factors, and genomic/proteomic approaches to disease analysis.

**PATH 232. Statistical Methods and Experimental Design (2)**
This course will emphasize the relationships between experimental design, statistical methods, and biomedical research. The content of the course will include basic issues in experimental design and commonly used statistical methods. The assumptions behind the statistical tests, their appropriate use, and examples of misuse will be discussed.

**PATH 296. Directed Reading (1–4)**
Reading and laboratory study of special topics under the direction of a faculty member. Exact subject matter to be arranged in individual cases.

**PATH 299. Independent Study or Research (1–12)**
Independent study or research.

**SOM 213. Histology (2)**
This course teaches the structural basis of normal and abnormal function at the cellular and tissue levels. Emphasis is based on microscopic study conducted in small laboratory groups under close faculty supervision.

**SPPS 215. Human Disease (3)**
This introduction to human disease includes etiology and mechanisms of common disease states and integrates pathology with previous core curriculum. The focus will be to understand disease processes and the dynamics of changes related to drug therapy. Our goal is to give the student an overview of the illnesses and disorders of human organs, systems and functions, in other words, human disease, with the hope that this background will lead the students to clinical understanding of patients and future insight into the pathogenesis of disease and new treatments. This course will include general pathology and system based pathology, taught in lecture, case discussion, and lab format.
